

*** BACK UP YOUR PRESETS BEFORE UPGRADING THE EDITOR ***

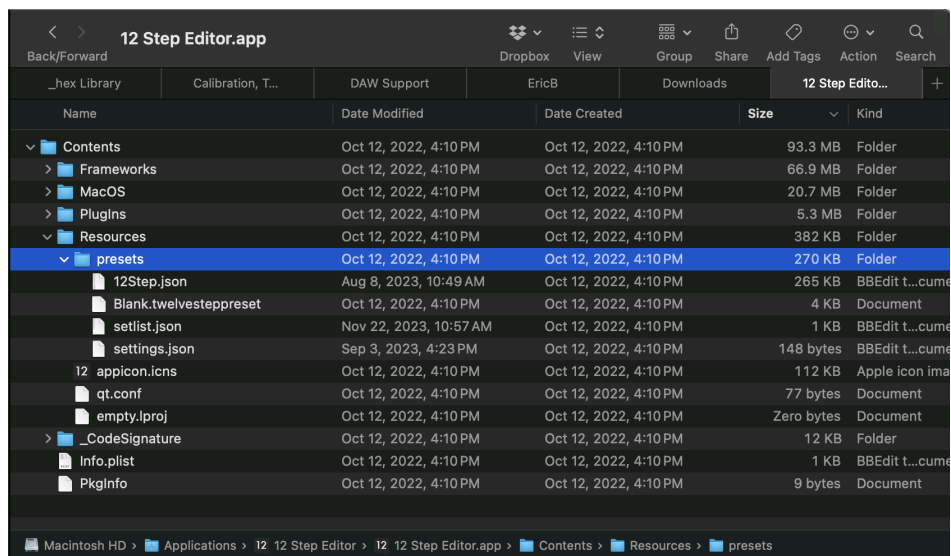

12 Step MacOS editors prior to 3.0.0 stored the setlist, presets, and settings inside of the application folder. This meant that they would get deleted anytime you would reinstall or upgrade the editor.

To back up your presets, do the following:

- Open finder to your Applications folder
- While pressing [control], click the 12 Step Application once, and select “Open Package Contents”

- The presets folder is located in the Contents/Resources folder. We recommend you copy the entire presets folder to a safe, known location. The new editor will prompt you to import them the first time that it is run.

(continued next page)

The 3.0.0 editor stores presets in the Application Data Directory, which is a tree of folders sandboxed by MacOS. You can access this directory with the 3.0.0 Editor File menu, select the “Open Editor Preset Directory” command. These files will remain on your system even if you upgrade or delete the editor.

You can manually back up and restore these files as needed. If for some reason they are missing, the editor will prompt you to either re-import them, or it will load the factory defaults.
